Introduction

Grant Background

In August 2023, the Indiana Department of Education (IDOE) invited accredited school corporations and school organizations to [apply for a one-time competitive grant opportunity](#) to fund a pilot of an artificial intelligence (AI) powered platform of their choosing for the 2023-2024 school year. This opportunity supported a one-year implementation and funded subscription fees and professional development to support high-dosage tutoring for students and reduce teacher workload through the use of an AI platform. This grant provided an opportunity for school corporations to target support to a specific building, grade level, subject area, or student population by integrating an AI platform with a cohort of teachers and students. Schools were encouraged to focus on student needs in response to [academic impact data](#).

The [awardees](#) consisted of **112 schools**. This included 2,466 teachers¹ and 45,244 students from 36 school corporations across the state.

AI Platforms

IDOE established AI platform [vendor requirements](#) for schools to use as part of their selection process. In alignment with local control structures, schools had the autonomy to choose vendors that best met their unique use cases and establish a contractual relationship directly with their chosen vendor. The following platforms were selected by schools and met the platform vendor requirements: [Amira](#), [Chat for Schools](#) (Skill Struck), [Edia](#), [Khanmigo](#) (Khan Academy), and [SchoolJoy](#). Table 1 shows the number of school corporations, individual schools, teachers, and students utilizing each platform as part of the AI pilot.²

Table 1. Breakdown of pilot participation by platform vendor.

	Amira	Chat for Schools	Edia	Khanmigo	SchoolJoy
Corporations	11	3	2	20	1
Individual schools	54	10	3	56	2
Teachers	904	294	84 ³	1,174	10
Students	17,785	6,121	460	20,658	220

¹ This is based on approved applications. However, schools reported 1,721 teacher participants at the end of the grant cycle.

² This information is based on approved grant applications.

³ The actual number is 5. A school informed IDOE in May 2024 that their submission contained an error.

Teacher Feedback Survey

In April 2024, IDOE launched a survey to collect feedback from all teachers who were part of the pilot grant. The survey allowed teachers to provide direct input on their experience using the AI platforms. The primary goals of the survey were to understand platform usefulness, student and teacher impact, training effectiveness, and the overall experience using the platform. The survey collected both qualitative and quantitative data, with qualitative data being analyzed through an open-coding process. Preliminary survey results and site visit observations were presented at the [Indiana State Board of Education meeting](#) in June 2024.

Response Sample

625 individual teachers responded to the survey during the window of Wednesday, April 17, through Friday, May 17. Tables 2, 3, and 4 show the response distributions by grade level, subject area, and platform. Tables 2 and 3 include data for questions with multi-select responses; therefore, the total number of responses is greater than the response sample.

Report Response Sample: 625 Teachers

Table 2. Number of survey respondents by grade level.

Grade Level	Number of Selections <i>Respondents could select multiple options that apply.</i>
Kindergarten	35
1	56
2	52
3	81

Subject Area	Number of Selections <i>Respondents could select multiple options that apply.</i>
English/Language Arts	335
Mathematics	243
Science	109
Social Studies	92
Other	107

Table 3. Number of survey respondents by platform vendor.

Platform	Number of Teachers
Amira	148
Chat for Schools	43
Edia	5
Khanmigo	425
SchoolJoy	4

Prior Usage

13% of surveyed teachers reported prior experience using the specific platform, and 11% used a similar platform or tool before the pilot grant. For those who reported using a similar platform or tool prior to the pilot grant, more than 50% indicated ChatGPT was the platform.

Use of Platforms

Teachers were asked how frequently they used their pilot grant's AI platform for their own tasks. Figure 1 illustrates the frequency of use. Nearly 50% of respondents reported using the platform about once a week or more.

Figure 1. Frequency of platform usage by teachers.

The platforms were used for a variety of teaching-related tasks. Figure 2 illustrates the type of reported tasks. Lesson planning received the highest amount of responses, followed by differentiation support and subject area knowledge support.

Figure 2. Types of tasks the platform was used for.

Teacher Impact

One of the primary aims of the survey was to understand the pilot's impact on teaching practices. In a Likert scale question, 53% rated the overall impact of using this platform on their teaching practice as positive or very positive, with nearly 40% indicating unchanged, as shown in Figure 3.

Figure 3. Impact on teaching practice.

As a follow-up to the Likert scale question, respondents were asked to explain their rating in an open-ended question. The top responses⁴ are outlined in the following sections with exemplifying quotes.

Saving Time

The most frequent response related to the impact on teaching practices was the ability for teachers to save time using the AI platform. The remaining top responses were all closely tied to saving time by using the platforms.

The responses included examples of how time saved from using the AI platform could be allocated to more instructional time and providing support for students.

"It has saved me a significant amount of time lesson planning while also providing me with quality material to use to grade or promote discussion and critical thinking in my students." - High School Teacher

⁴ A full set of coded responses can be found in the appendix.

*"[The AI platform] made it easier for the students to address minor issues they were having without needing the check with me. **This freed up my time to help students with bigger issues they were having.** I also was able to do more mundane tasks faster which again freed up my time to help my students more one-on-one."* - 7th Grade Teacher

*"I don't believe that the AI platform makes me a better teacher or increases my teaching abilities by itself, **BUT it does free up time from menial tasks** so that I can focus on the bread and butter of a quality educator - **instructional time and one-on-one coaching/interaction.**"* - High School Teacher

Content and Idea Generation

Teacher responses outlined how using the platforms to generate content and ideas (including lesson plans, assignments, and student materials) was impactful on their teaching practice.

*"My teaching is more **innovative** because I am able to generate student materials in **1/100th of the time.**"* - High School Teacher

*"It has allowed for me to **create assignments or even just ideas that I have into fun and engaging lessons.**"* - 6th Grade Teacher

Instruction and Differentiation Help

Teachers also shared how the platforms assisted in differentiating instruction for their students.

*"I enjoy being able to see various levels of differentiation and get ideas on **better differentiation techniques to meet the needs of my learners.**"* - 4th Grade Teacher

*"It made things faster, but ultimately, **it gave my students more differentiation** and the capacity for asking the AI questions to help assess."* - High School Math Teacher

Data and Assessment

Teachers reported the ways the AI platforms could be used to assess students and provide data that could then be used to help teachers provide targeted support.

*"This platform helped me to **assess students in a more timely manner** and freed up time for me to work with certain groups **based on the data given**." - 2nd Grade Teacher*

*"One of the most useful aspects of [the AI platform] was its **extremely in-depth data tracking** method. The app showed **every single skill** that a student either was behind, approaching, or proficient in at every single grade level available." - 5th Grade Teacher*

Communication

Using the platforms for communication purposes was another frequent response. This included teacher use of the platform to assist with tailoring communication to sound more professional or positive, generating recommendation letters in less time, and improving communication with parents.

*"As a math teacher, it is just nice to have a **professional sounding email and response** without asking an English teacher to proofread it." - 8th Grade Teacher*

*"It has made my parent emails sound **better and more positive**." - 7th Grade Teacher*

*"AI has really helped me **improve my communication to parents** regarding conversations I have with their student. I add a few bullet points to the chat that detail what we talked about and it turns it into an email. This has really helped parents and I hold students accountable to what has been agreed upon." - 9th Grade Teacher*

*"I struggle to find the correct way to **communicate my ideas** and the platform has helped." - 1st Grade Teacher*

Extra Practice for Students

Teachers reported that extra practice generated by the platform helped students reinforce topics and lessons both in the classroom and at home. Teachers shared that students could select the areas where they needed additional practice, or the platforms provided an avenue for assistance when they were stuck on a particular topic. While this is student focused, lesson and skill reinforcement helps teachers progress through curriculum, and this can save time for teachers.

*"It helped to have videos and questions for the students to do on their own to **help reinforce the skill that I taught**. They used the AI to help them if they were stuck on a problem and I was working with another student and couldn't help at that time or if they were home." - 4th Grade Teacher*

*"Having an unlimited question bank was not only such a huge time saver for me, it **allowed students to practice on any area as much as they want**." - High School Teacher*

Student Impact

Another primary goal of the survey was to understand the pilot's impact on student learning. In a Likert scale question, 53% of teachers rated the overall impact of using this platform on their students' learning as positive or very positive, with nearly 40% indicating unchanged as shown in Figure 4.

Figure 4. Impact on student learning.

As a follow-up to the Likert scale question, respondents were asked to explain their rating in an open-ended question. The top responses are outlined in the following sections with exemplifying quotes.

Tutoring, Guidance, and Feedback

Teachers discussed the ability of the platforms to tutor students by guiding them through a question or problem rather than providing a direct answer. Many of the platforms are designed

to tutor students through a question by providing guidance and feedback for each step a student completes to work towards developing a final answer. For example, the platforms asked students guiding questions to help them arrive at the correct answer or gave them feedback on an incorrect answer. Note: This is one way that educational generative AI platforms differ from those publicly available, such as ChatGPT. The platforms built for K-12 education are designed to coach students to arrive at an answer independently rather than simply providing an answer.

*"Students feel empowered to **ask questions and learn instead of just being given the answers**. It is useful to them when I am not available. It also helps with brainstorming and idea generation."* - High School Teacher

*"They get to see for themselves the mistakes they are making **as soon as they submit the answer**."* - High School Teacher

*"I love that they can ask questions and not get a direct answer - **they have to still think problems through**."* - 6th Grade Teacher

Student Buy-In

Many teachers reported that students enjoyed using the platforms. While some indicated that students did not like it, more reported that students liked using the platforms.

*"Students were asking to complete this program **even when they were not asked to do so**. It had a positive impact - it also allowed my EL [English Learner] students who were not fluent in English get that exposure of reading in English. It was nice."* - 4th Grade Teacher

*"Students look forward to learning using this platform and checking their learning progress. They **naturally set goals for themselves/the class** to beat during the week."* - 3rd Grade Teacher

*"Kids don't like to be forced to use anything, but I feel **they LIKE to use this**."* - 9th Grade Teacher

Extra Support and Practice

Similar to teacher impact responses, teachers noted how extra practice and support through the platforms helped students reinforce topics and lessons, including those who needed additional help.

*"I believe that it has been positive because it gives **more opportunity for them to review and study topics** that they may struggle in."* 7th/8th Grade Teacher

*"It allowed students to focus on areas they needed **extra review** before assessments."* - High School Teacher

Academic Improvement

Some teachers reported that they noticed academic improvement and growth in students who used the platforms. Please note, as with all survey data discussed, this is self-reported data and not conclusive evidence of student outcomes.

*"4/5 of my students who used the [AI platform] have **grown substantially in their reading fluency and accuracy**."* - 3rd Grade Teacher

*"I have noticed that students' **quality of work has improved**. Students are using [AI platform] as a tool to help them write better or to help them think more critically."* - 6th-8th Grade Teacher

*"The students who used it often had **better outcomes and educational growth** than I have seen in previous years."* - 10th Grade Teacher

Independence and Confidence

Teacher responses also noted student independence and confidence, fostered through practice and autonomous learning options.

*"Many shy students are reading/talking louder. Students are **feeling more confident when reading in small groups**."* - 3rd Grade Teacher

*"Students were able to get more small group time with me and **build their confidence** doing this assessment on their own."* - 2nd Grade Teacher

Personalized Learning

Personalized learning was also a prominent theme in teacher feedback. Teachers indicated that the platforms' personalized capabilities gave more tailored support to individual student levels.

"This platform has increased clarity for students in expectations and offered more personalized learning." - K-4th Grade Teacher

"Students using the platform were engaged, and the self-leveling aspect made sure that student needs were being met at their level." - K-3rd Grade Teacher

Training

A commitment to providing high-quality training to participating teachers across multiple modalities was an IDOE requirement for any platform vendor schools selected. Vendor training was required to consider thoughtful integration of the platform within blended and/or virtual learning models, including onboarding support, platform training (both technical and pedagogical), periodic check-ins on a schedule agreed upon between the vendor and school, and guidance to support teachers in providing child safety instructions to students and parents. Figure 5 illustrates the number of training sessions provided by the AI platform vendor that the teachers reported attending.

Figure 5. Amount of vendor training sessions attended by teachers.

Figure 6 shares how teachers rated the effectiveness of vendor platform trainings. 62% indicated that the training provided by the platform vendor on using the platform was very or somewhat effective. 42% reported that their schools offered additional professional development related to AI.

Figure 6. Training effectiveness.

Challenges

As with any program or platform, teachers and students encountered some challenges. The challenges outlined in this section were identified in responses to multiple open-ended questions.

User Experience

Some responses indicated that it was difficult for both teachers and students to use the platforms. Platform navigation was a prominent difficulty, and other user experience challenges included the platform sharing incorrect answers, difficulty for teacher/student understanding of platform information, and non-microphone technical difficulties. One teacher shared the following example:

"It was not easy for students to use. They had trouble finding the information. It took a lot of time and assistance from staff to get the students where they needed to go. The students were frustrated by how many steps they had to complete to get where they needed to." - High School Teacher

Another aspect of the user experience challenges was that sometimes answers given by the AI platforms were incorrect. While not optimal, this is a known shortcoming of AI platforms and

illustrates the importance of AI literacy at all levels. Understanding how AI operates and its common pitfalls allows users to be proactive and build practices that harness the benefits of AI while knowing its limitations.

Microphone Issues

Issues with microphones and accurately recognizing speech were separated from other technical difficulties because of their specificity and prevalence across multiple questions. One teacher shared this example:

"Students get frustrated easily when the computer doesn't pick up on what they are trying to say."
- 3rd Grade Teacher

A different teacher shared another example:

"Many times the computer didn't register a student's voice correctly, so the platform would go into remediation mode when the student didn't need the remediation. Students became frustrated with the repeated lessons on concepts they already knew." - 1st Grade Teacher

Content for All Subject Areas

Some teachers mentioned that there was not as much content for certain subject areas compared to others, which resulted in less use for some. Some subjects with less content mentioned include music, health, and art.

Other

There were also other varied challenges mentioned in responses, though not as prevalent as the three previous examples. Some responses discussed teachers preferring to do tasks themselves rather than using technology to assist or having existential concerns about the future of AI. Other teachers noted difficulty in finding time to get familiar with and use the platforms.

AI Platforms

This data alone should not be used as evidence for selecting and procuring a specific AI platform vendor. Numerous factors can impact this data including, but not limited to, the number of survey responses, length of teacher/student use of the platform, subject area, implementation size, attitudes towards AI, etc. The primary purpose of the inclusion of this data is to promote transparency in reporting feedback based on the first year of the AI pilot grant.

Amira

As shown in Figures 7 and 8, 46% of teachers who used Amira indicated having a positive or very positive impact on their teaching practices, and 59% of teachers gave the same rating for impact on student learning. Of the respondents that selected 'negative' or 'very negative' as shown in

Figure 7, 52% reported never using the platform or using it less than once a week for their own tasks.

Figure 7. Amira teaching practice impact.

Figure 8. Amira student learning impact.

Teachers liked these aspects of the Amira platform:

- Detailed data, including the ability to listen to student recordings
- Lessons tailored to a student's level
- Engaging for students
- Immediate feedback to students
- Platform can be used independently

Teachers disliked these aspects of the Amira platform:

- Does not always accurately recognize what students are saying
- Difficulty if the environment is too loud
- Issues with saving progress, particularly when long passages couldn't be finished due to time constraints

Chat for Schools

As shown in Figures 9 and 10, 72% of respondents who used the Chat for Schools platform indicated having a positive or very positive impact on their teaching practices, and 47% gave the same rating for impact on student learning. Of the respondents that selected 'very negative' in Figure 9, 100% reported never using the platform or using it less than once a week for their own tasks.

Figure 9. Chat for Schools teaching practice impact.

Figure 10. Chat for Schools student learning impact.

Teachers liked these aspects of the Chat for Schools platform:

- Creating content including lesson plans, assignments, and assessments
- Ability to create specific chat tutors for students
- Guardrails and safety with data privacy and flagging inappropriate content
- Ease of use

Teachers disliked these aspects of the Chat for Schools platform:

- Open chat feature was initially available and teachers disliked that feature, but mentioned that Chat for Schools/Skill Struck gave the ability to disable it.

Edia

While Figures 11 and 12 show impact ratings, please note the small number of respondents. A sample size of only five responses can impact the reliability and validity of the data, which may lead to less representativeness of the larger population. With a limited number of responses, outliers can disproportionately influence the results, making it challenging to draw accurate conclusions. The inclusion of this platform's data is only present for transparency and fairness.

Figure 11. Edia teaching practice impact.

Figure 12. Edia student learning impact.

Teachers liked these aspects of the Edia platform:

- Creating assignments
- Tailoring questions for different students
- Step-by-step help

Teachers disliked these aspects of the Edia platform:

- Search terms did not match results
- Some areas have very few or no questions to use for topics
- It's picky about how students enter answers for questions

Khanmigo

As shown in Figures 13 and 14, 53% of respondents indicated using Khanmigo had a positive or very positive impact on their teaching practices and 50% gave the same rating for impact on student learning. Of the respondents that selected 'negative' or 'very negative' on teaching impact, 74% reported never using the platform or using it less than once a week for their own tasks.

Figure 13. Khanmigo teaching practice impact.

Figure 14. Khanmigo student learning impact.

Teachers liked these aspects of the Khanmigo platform:

- Creating content including lesson plans, assignments, rubrics, and assessments
- The variety of features and options
- Tutoring options
- Writing assistance

Teachers disliked these aspects of the Khanmigo platform:

- Explanations could sometimes be too wordy for students
- It was difficult for some students and teachers to navigate with some mentioning there was an abundance of features and information

SchoolJoy

While Figures 15 and 16 show impact ratings, please note the small number of respondents. A sample size of only four responses can impact the reliability and validity of the data, which may lead to less representativeness of the larger population. With a limited number of responses, outliers can disproportionately influence the results, making it challenging to draw accurate conclusions. The inclusion of this platform's data is only present for transparency and fairness.

Figure 15. SchoolJoy teaching practice impact.**Figure 16.** SchoolJoy student learning impact.

Teachers liked these aspects of the SchoolJoy platform:

- Ability to tailor content to student needs and interests
- Creating content quickly
- Platform vendor is responsive to requests

Teachers disliked these aspects of the SchoolJoy platform:

- Not being able to print directly from the platform and instead having to copy and paste into a separate document

Vendor Data Overview

Each platform vendor reported data they typically collect as part of their practices. Due to the nature of differing types of reported data, these are not combined into a larger data set. The following highlights for each platform were provided directly from the vendors.⁵

Amira

Figure 17. Amira WCPM Acceleration *Students who took benchmarks but did not engage with Amira Practice.

Chat for Schools

Table 4. Chat for Schools data overview.

Category	Metric	Data	Notes
Usage Totals	Teacher Users	185	N/A
	Teacher Unique Logins (August 1, 2023 - April 29, 2024)	198	

⁵ Data are directly from platform vendors with some formatting changes for cohesion.

	Total Teacher Chats	1186	
	Total Teacher Prompts	6,439	
	Student Users	817	
	Student Unique Logins (August 1, 2023 - April 29, 2024)	869	
	Total Student Chats	3,090	
	Total Student Prompts	19,330	
Learning Studio	Quizzes	100	Created by teachers using AI
	Lesson Plans	97	Created by teachers using AI
	Transformed Texts	21	Created by teachers using AI
	Specialized Tutors	96	Custom Chatbot created by teachers
Student Tutor Overview	Tutor Chats	286	N/A
	Specialized Tutor Chats	578	Custom Chatbot
Tutor Usage Breakdown⁶	Computer Science	14%	Average % across 3 school corporations
	History	72%	Average % across 3 school corporations
	Language Learning	17%	Average % across 3 school corporations
	Math	42%	Average % across 3 school corporations
	Science	13%	Average % across 3 school corporations
	Writing	60%	Average % across 3 school corporations
Alerts	All-Time Total Alerts	183	Alerts can be generated by teacher or student

Edia

This platform vendor did not provide any data, though numerous requests were made by IDOE through written communication and a virtual meeting.

Khanmigo

9,673 Indiana students used Khanmigo during the 2023-2024 school year, and 40% of those had an average of 40+ Khanmigo interactions to support learning in the learning weeks from January to early May. The top student activities are outlined in Table 5. 697 Indiana teachers utilized Khanmigo during the 2023-2024 school year, and reviewing student performance and trends was the most frequently used teacher tool, as shown in Table 6.

⁶ Tutor usage breakdown updated from vendor submission to reflect the average percentage across three school corporations.

Table 5. Khanmigo top student activities.

Top Five Khanmigo Student Activities	
1. With an exercise	Pairing Khanmigo with Khan Academy content exercises
2. With a video	Leveraging Khanmigo alongside Khan Academy content
3. Tutor me math and science	Khanmigo tutoring in math and science to support, not answer, student questions
4. Academic essay feedback	Share the grade level, essay type, and assignment to get customized feedback from Khanmigo
5. Chat with a historical figure	Khanmigo simulated conversation with a blast from the past

Table 6. Khanmigo top teacher tools.

Top Five Khanmigo Teacher Tools	
1. Class Snapshot	Review student performance and trends
2. Refresh my knowledge	Teacher tool to refresh content knowledge in various subject areas
3. Lesson Plan	Create structured, detailed lesson plans tailored to your curriculum/needs
4. Exit Ticket	Create quick end-of lesson assessments to check student understanding
5. Lesson Hook	Plan compelling lesson starters to engage students

18 of the 20 school corporations using Khanmigo as part of the pilot used Khan Academy alongside Khanmigo. Table 7 shows the amount of learning minutes, top courses used, and skills leveled up or to proficiency.

Table 7. Khan Academy data.

Learning: November 1, 2023 - May 3, 2024	Top Five Courses Used	Skills Leveled Up Skills to Proficiency
12,517 students worked in Khan Academy courses for an average of 268 learning minutes.	- Digital SAT Math - Digital SAT Reading & Writing - Algebra 1 - Grammar 8th Grade Math	- Averaged 28 skills leveled up, of which 20 were leveled up to proficient 36% of students averaged proficiency in one skill every week.

SchoolJoy

499 students from grades 6 through 12 completed the LaunchPad Assessment in which students provide information on their interests and values, including future plans as shown in Figures 18 and 19. This information can be integrated into teachers' planning tools and students' learning experiences.

Figure 18. Future student plans for grades 6-8.

Figure 19. Future student plans for grades 9-12.

Implementation Lessons Learned

The benefit of launching the grant pilot included identifying the strengths and challenges of this new grant program to better understand the impact. While many challenges were related to the platforms as described in previous sections, implementation lessons learned can be observed.

Usage

Actual usage was lower than what schools requested, and some teacher responses reflected this. Factors that impacted this include the accelerated launch of the grant and a delay for some schools in completing vendor training. Some teachers indicated they did not use the platform enough or had little time to gain familiarity. This can be addressed by ensuring grant processes provide ample time for schools to adequately prepare, schedule training, and implement platforms with fidelity whenever feasible.

Training

20% of teacher responses said they did not attend any training sessions provided by the vendor. Due to this question being multiple choice, no claims on reasons can be made. This challenge will be addressed through verification documentation and regular check-ins with the schools to assist with any potential barriers in training or general implementation.

Additional Guidance

As discussed in the *Challenges* section, some teachers indicated there was not as much relevant content for their subject area. Schools may need further guidance beyond the vendor requirements on what to evaluate and consider when selecting a vendor, including subject areas. The other two identified challenges - user experience and microphone issues - might also benefit from additional guidance. While IDOE cannot change platform capabilities or address potential technical challenges, guidance on what to do if teachers encounter these types of issues may be necessary, as well as the option for IDOE to facilitate feedback to the platform vendors on behalf of schools.

Conclusion

Indiana's AI-Powered Platform Pilot Grant provided an opportunity for 112 schools across the state to utilize an AI platform for high-dosage tutoring for students, reducing teacher workload. Indiana recognized the importance of gathering direct feedback on the pilot from those who can best speak to the experience of implementation - teachers. The teacher feedback survey highlighted both the impacts and challenges of using the AI platforms for teaching practices and student learning. Teachers reported positive impacts on their teaching practices including saving time, being able to generate content and ideas, access to data, communication assistance, and more. Some of the teacher-reported positive impacts on student learning included access to tutoring and guidance, direct feedback on work, enjoyment for students using the platforms, ability to obtain extra practice and support, academic improvement, increased independence and confidence, and more. While the pilot has concluded, efforts to support the use of AI and the growth of AI literacy are ongoing through multiple avenues including the Digital Learning

Grant, AI-Supported Alternative Education Grant, and Digital Learning Coach Grant. Visit [IDOE's Office of Digital Learning webpage](#) for additional information.

APPENDIX

Qualitative Response Details

Teaching Impact

Code terms	Definition/Markers	% of coded responses
Saves time	Using the platform saves time and/or provides more time for other tasks	23%
Content and idea generation	Using the platform for lesson planning, lesson materials, brainstorming, etc.	22%
Instruction and differentiation support	Platform assisting with differentiation content and lesson planning, “meeting students where they are”, content at student level, targeted feedback	17%
Data and assessment	Targeted data on each student, ability to conduct assessments and get additional data	7%
Communication	Proofreading, first draft generation, generating recommendation letters, improve writing clarity	6%
Extra practice	Providing an option for students to get additional practice and have lessons reinforced	6%
Microphone issues	Issues with speech recognition, microphone function, etc.	5%
User experience	Navigation challenges, “not user friendly”, difficulty using	4%
Lack of applicable content	Limited content for certain subject areas, not enough content in a subject area to be impactful	3%
Tech issues		3%

Resistance	Preference for creating their own content/not using, lack of trust in AI, “AI is not better than humans”	3%
Task assistance	General assistance with tasks	1%

Student Impact

Code terms	Definition	% of coded responses
Tutoring, guidance, and feedback	Students receive tutoring, tailored support, step-by-step assistance, targeted feedback	25%
Student buy-in	Students like using the platforms, student engagement	13%
Extra support and practice	Students receive extra help and practice	9%
Improvement	Teachers note academic improvement	7%
Independence and confidence	Self-efficacy, autonomy, accountability, freedom of choice, growing confidence in skills	5%
User experience	Navigation challenges, “not user friendly”, difficulty using	5%
Microphone issues	Issues with speech recognition, microphone function, etc.	4%
Personalized learning	Students get content specific to their level and/or interests, in-the-moment support	3%
Resistance	Preference for creating their own content/not using, lack of trust in AI, “AI is not better than humans”	3%
Tech Issues	General technology issues such as bandwidth and user errors	2%

AI literacy	Not understanding how AI works	1%
-------------	--------------------------------	----
